

HARNESSING THE POWER OF COM Express[®]

COMe-bEP7 module based on AMD EPYC™ 3000 Series Processors
to Increase Speed and Lower Costs

CHALLENGE

- ▶ Reducing power consumption while also improving performance and lowering costs
- ▶ Staying with a common industry standard form factor, in this case, COMe (12 per system)
- ▶ Supporting 10Gb Ethernet for high-speed communications between modules

SOLUTION

- ▶ Kontron's COMe-bEP7 roadmap included the EPYC CPU, resulting in a cost-effective replacement for their current COMe module
- ▶ Implementing AMD's EPYC family of CPUs to lower power requirements while enabling higher performance at a lower cost than the CPU the customer currently used
- ▶ Kontron's ability to support 10Gb Ethernet solves customer challenge

BENEFITS

- ▶ Kontron is an industry leader in COMe and COM-HPC technology, making them highly capable of solving the current problem while producing future solutions as well
- ▶ Providing reduced power consumption and better performance reduced the overall cost of the systems
- ▶ Able to supply High-speed 10Gb Networking support currently with the ability to access 40Gb in the future
